

Scanning an article using Adobe Acrobat Professional and the Epson 4180 scanner.

Place document face-up and right-reading on Automatic Document Feeder or open scanner lid.

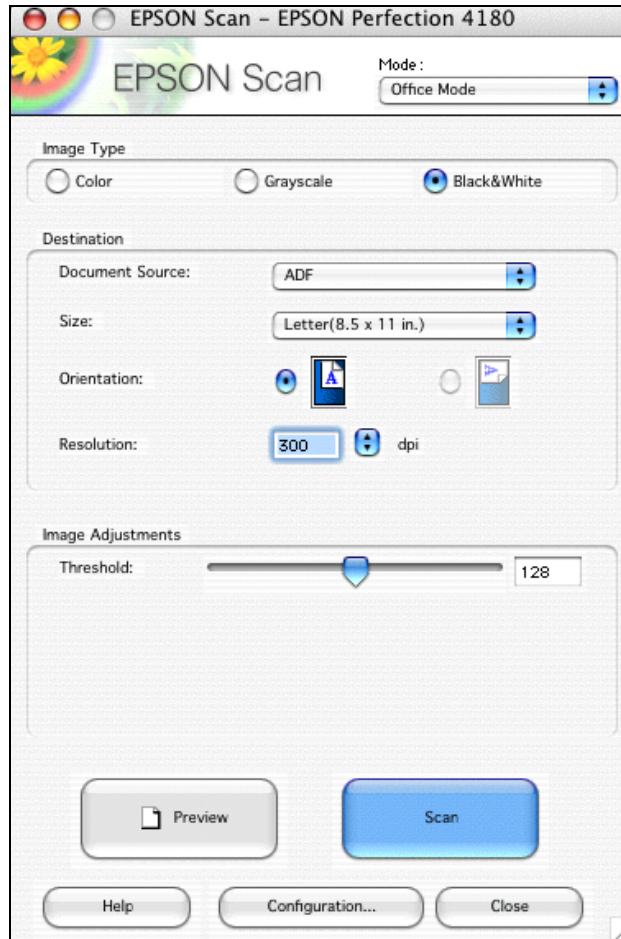

Open Adobe Acrobat 6.0 and from the Create PDF menu choose **From Scanner ...**

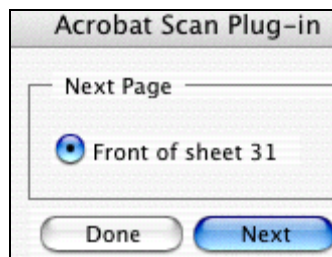

This dialog box appears. Make sure the selections match the selections in this image and select the Scan button.

Make these selections in the Epson Scan dialog box that appears and select the Scan button. Under Options you can leave it at Compatible with Acrobat 5.0 or later.

When you are finished scanning select Close on the above dialog box.
Then the Acrobat Scan Plug in box appears, click Done or click Next if the scanner jammed.

Save and name the file. If you are starting another file be sure to close the window of the current and start over at step 1. Make the name of the file short (less than 10 characters) and no spaces or special characters. Once a file has been saved into a folder, then close that document to start another. A frequent problem that happens is the scanning of several files to be one continuing PDF. This will not happen if you save each pdf and close that window before starting a new document.
